Introduction:

Figure: Aedes aegypti mosquito

Dengue fever, a mosquito-borne viral disease, has emerged as a significant public health concern in Bangladesh. With its tropical climate, rapid urbanization, and dense population, the country provides a conducive environment for the proliferation of Aedes mosquitoes, the primary vectors of dengue. Over recent years, the frequency and severity of dengue outbreaks have escalated, leading to substantial morbidity and mortality and imposing a severe burden on the healthcare system.

This topic is of paramount importance because dengue not only affects public health but also has far-reaching social and economic consequences. During outbreaks, hospitals become overwhelmed with patients, while families face emotional and financial stress due to treatment costs and lost productivity. Furthermore, the lack of awareness, inadequate vector control measures, and insufficient urban planning exacerbate the problem.

By evaluating the factors contributing to dengue outbreaks—such as environmental conditions, urbanization patterns, public health infrastructure, and socio-behavioral practices—this research aims to identify actionable strategies for sustainable prevention and control. Understanding these dynamics is crucial for developing targeted interventions, minimizing the impact of future outbreaks, and promoting long-term public health resilience in Bangladesh.

Background

In Bangladesh, the disease has transitioned from sporadic outbreaks to an annual epidemic, with record-breaking cases reported in recent years. Bangladesh's vulnerability to dengue outbreaks can be attributed to several interrelated factors. Climatic conditions, including high temperatures, prolonged monsoons, and increasing humidity, create ideal breeding environments for *Aedes* mosquitoes. Rapid and unplanned urbanization has led to poor waste management, stagnant water accumulation, and overcrowded living conditions, which further exacerbate mosquito proliferation.

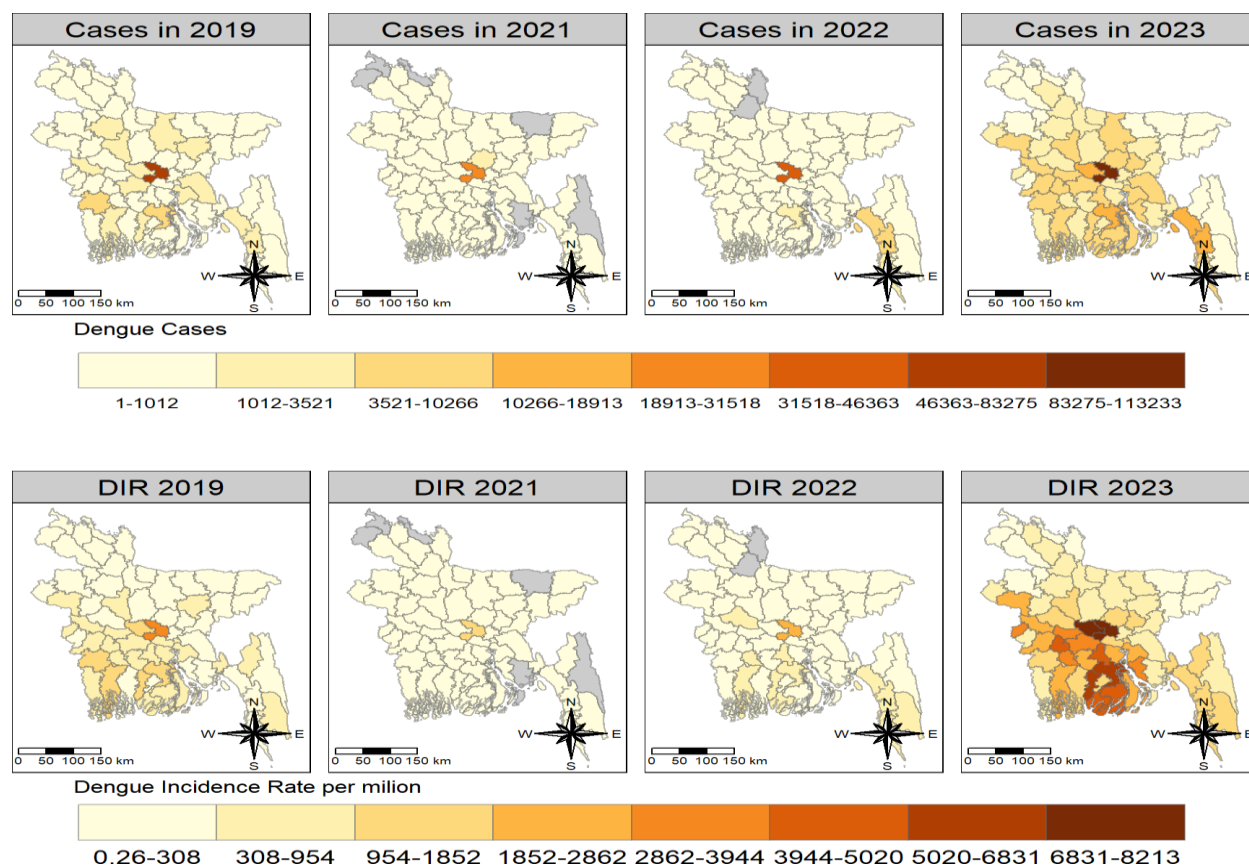

Figure: The spatial distribution of districtwide dengue cases and dengue incidence rate (DIR) per million in Bangladesh in 2019–2023.

Additionally, the country faces challenges in its public health response. Limited healthcare infrastructure, insufficient public awareness, and gaps in vector control programs hinder effective dengue management. The lack of coordinated urban planning and insufficient enforcement of environmental health regulations compound the problem.

Temporal patterns of dengue in Bangladesh during 2019 to 2024:

Dengue fever in Bangladesh has shown significant temporal and spatial variability between 2019 and 2024. This study analyzes the seasonal, monthly, and regional patterns of dengue outbreaks, identifies contributing factors such as climatic changes and urbanization, and proposes targeted control strategies. By leveraging epidemiological data, the research emphasizes the need for adaptive and region-specific interventions to curb future outbreaks

Implications for targeted control strategies:

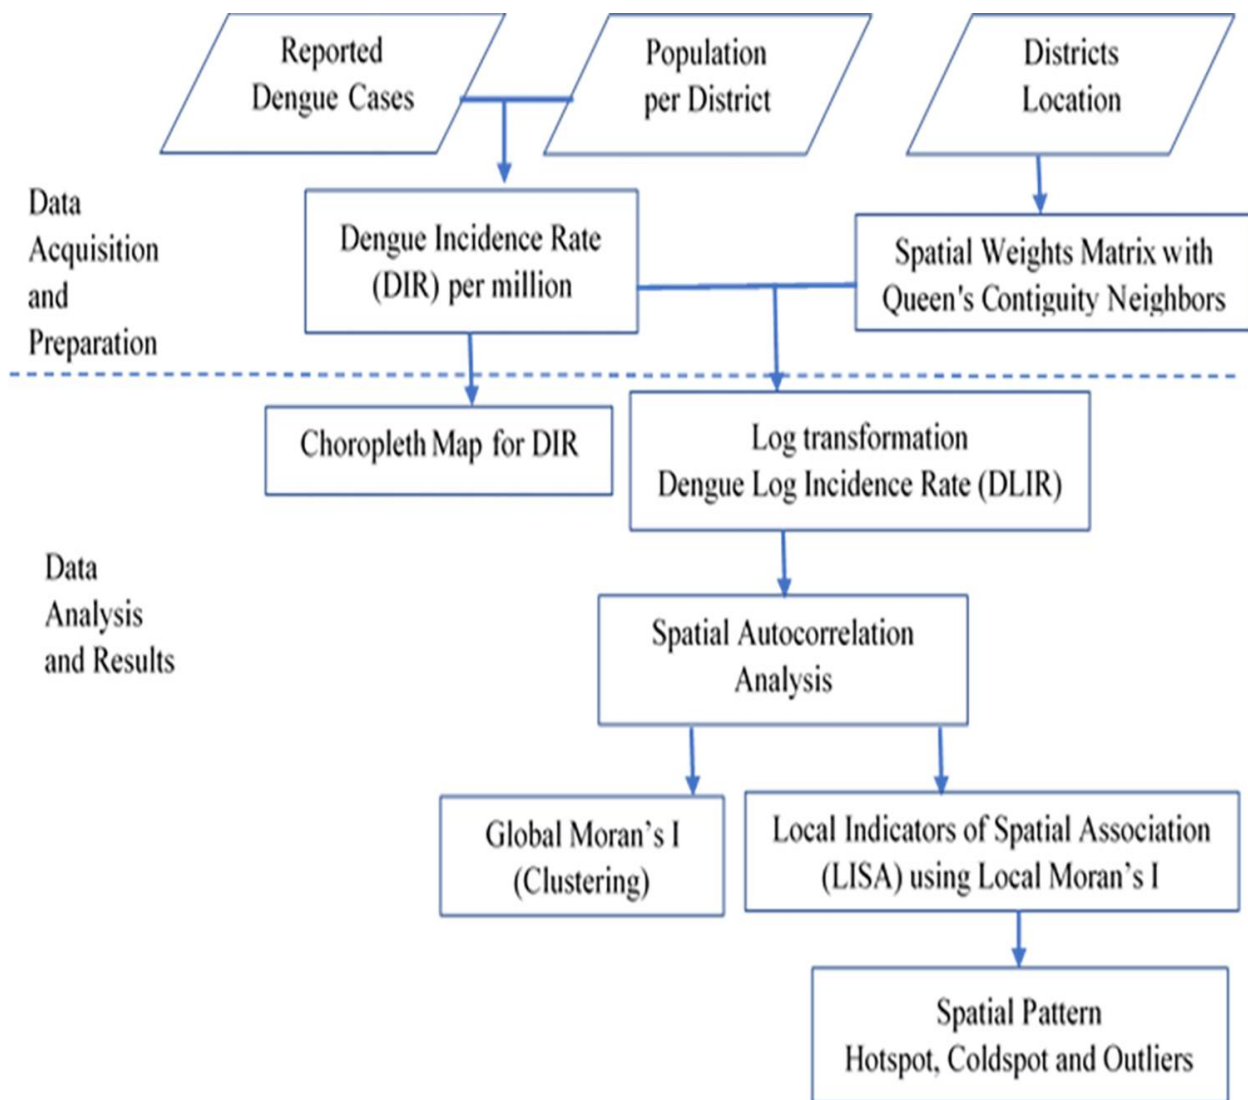

Figure: Flowchart of Methodology.

Data collection:

A cross-sectional survey was carried out among 14 - >60 (up to 75) years old randomly selected 1,010 peoples in nine administrative regions (**Dhaka, Comilla, Chittagong, Barisal, Khulna, Rajshahi, Rangpur, Mymensingh and Sylhet**) of Bangladesh between July and November 2024. An assumption of 50% prevalence of good KAP and an absolute precision of 5% were taken for calculating the minimal sample size which was found 385.

Popular data representation techniques for dengue information:

Unstructured, Semi-structured, and Structured data.

Results

Socio-demographic characteristics

A total of 1000 individuals were approached, only 900 were interviewed completely, giving a response rate of 91.82%. The profile of the respondents is given below in both Pie Chart and Table that summarizes:

What is your age?
7 responses

Where do you reside?
7 responses

What is your occupation?
7 responses

Table: Socio-demographic characteristics of the respondents in Bangladesh.

Characteristics	n (%)
Gender	
Male	506 (50.1)
Female	504 (49.9)
Age (year)	
1–15	38 (3.8)
16–30	551 (54.6)
31–45	249 (24.7)
46–60	124 (12.3)
61–75	48 (4.8)
Mean \pm SD*	31.96 \pm 13.8
Living place	
Village	545 (54.0)
Semi Town	269 (26.6)
City	196 (19.4)
Literacy status	
No formal schooling (illiterate)	127 (12.6)
Primary	172 (17.0)
Secondary	258 (25.5)
Intermediate	227 (22.5)
Graduate	180 (17.8)
Post Graduate	46 (4.6)
Employment status	
Job holder	88 (8.7)
Teacher	75 (7.4)
Businessman	107 (10.6)
Farmer	53 (5.2)
Student	347 (34.4)
Laborer	49 (4.9)
Housewife	213 (21.1)
Nothing as mentions	38 (3.8)
Others	40 (4.0)
Family income (Taka/month)	
<15,000	411 (40.7)
<30,000	344 (34.1)
<50,000	187 (18.5)
>50,000	68 (6.7)
Socio economic status	
Lower	163 (16.1)
Lower middle	303 (30.0)
Middle	474 (46.9)
Upper middle	70 (6.9)

Monthly distribution of dengue cases across Bangladesh in 2022–2024:

It is evident from Survey that months between January and March are poorly suited for dengue transmission. In April, some southern parts of the country, as well as the capital city of Dhaka, become highly suitable. Other parts of the country, except the northern most corner, become moderately suitable. Starting from May, the whole country becomes highly suitable, and the situation remains similar until **November**. The most northern part of the country becomes poorly suitable, whereas the capital and southern part stay highly suitable in **December**. After December, the whole country becomes poorly suited again, which continues until April.

Climate and Seasonal Factors
7 responses

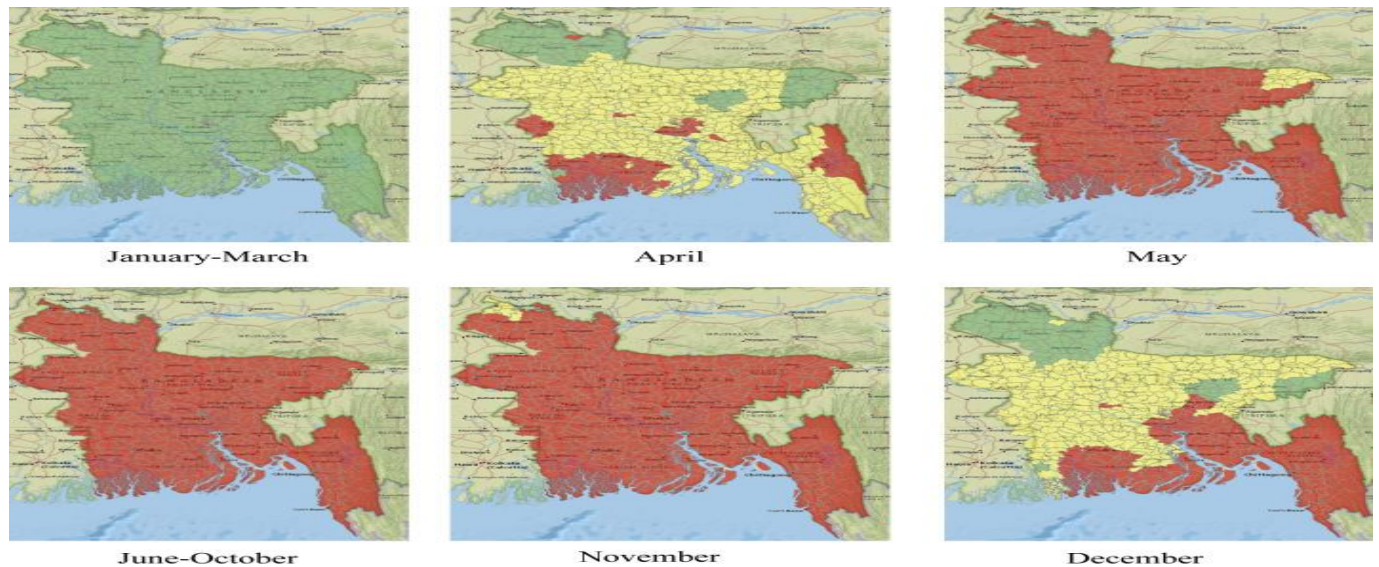

In which months do you observe higher mosquito activity?

Graph: Monthly distribution of dengue cases across Bangladesh in 2022–2024

Spatiotemporal suitability maps for dengue transmission in Bangladesh based on temperature.

The map represents suitability in the following manner: **green** (lowly suitable), **yellow** (moderately suitable), and **red** (highly suitable).

Methods of Biological Prevention and Control:

To combat the prevalence and spread of dengue disease, biological methods are the most environmentally favorable and sustainable options. Various natural and environmental components, including components of flora and fauna, function biologically to protect against the virus. It is extremely widespread in many nations across the globe, especially those that are considered less developed. Despite being an extremely primordial method, its success rate is exceptionally high.

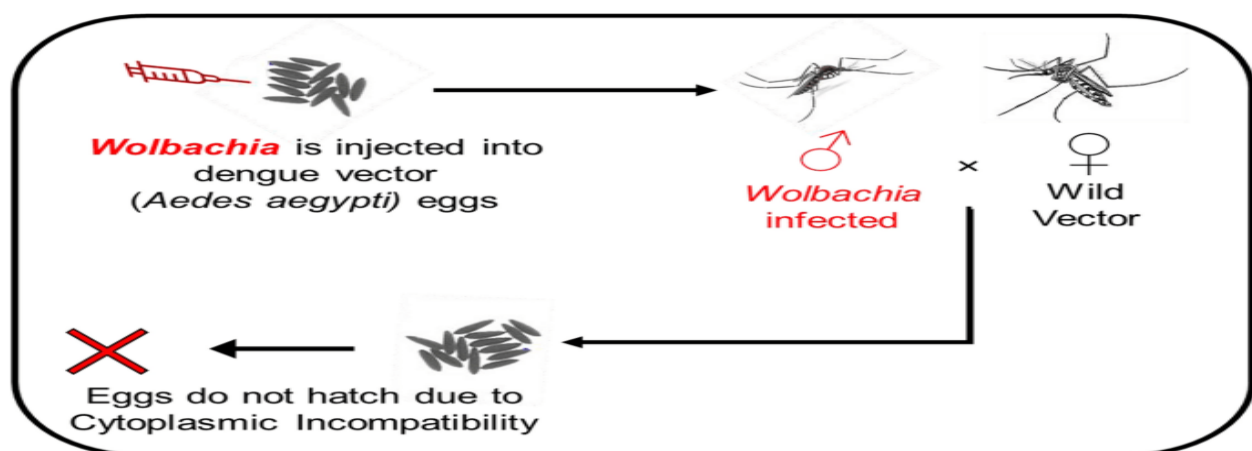

Figure: Biological dengue prevention

Methods of Chemical Prevention and Control:

Fogging, a chemical prevention system, is implemented in numerous countries across Asia and South America. In this chemical dengue prevention system, damp, dark areas are sprayed with chemical vapors to eliminate the disease's presence. This is prevalent in South Asian nations such as Bangladesh, Pakistan, and India. Usually, chemicals like pyrethroids, IGRs (Insect Growth Regulators), and pyriproxyfen are used in the fogging system.

Figure: Chemical spray dengue prevention

Methods of Community-Based Prevention:

The community-based prevention method is the most effective and efficient for a wide range of a number of reasons. Those are given here below:

ডেঙ্গু প্রতিরোধে এগিয়ে আসুন

ডেঙ্গু একটি ভাইরাসজনিত জ্বর যা এডিস মশার মাধ্যমে ছড়ায়। এই মশা সাধারণতঃ ভোরবেলা ও সন্ধ্যার পূর্বে কামড়ায়। সাধারণ চিকিৎসাভেই ডেঙ্গু জ্বর সেয়ে যায়, তবে ডেঙ্গু শক সিনড্রোম এবং হেমোরাজিক ডেঙ্গু জ্বর মারাত্মক হতে পারে। বর্ধার সময় সাধারণত এ রোগের প্রকোপ বাড়ে। এডিস মশার বংশ বৃদ্ধি রোধের মাধ্যমে ডেঙ্গু জ্বর প্রতিরোধ করা যায়।

ডেঙ্গু প্রতিরোধে এগিয়ে আসুন

আপনার ঘরে এবং আপোশে যে কোন জায়গায় পানি জমতে না দেয়া। ফলে এডিস মশার লার্ভা জন্মাতে পারবে না।

ব্যবহৃত পাত্রের গায়ে দেশে থাকা মশার ডিম অপসারণে পাজটি ট্রিচিং পাউডার দিয়ে ঘষে পরিষ্কার করতে হবে।

ফুলের টব, প্লাস্টিকের পাত্র, পরিত্যক্ত টায়ার, প্লাস্টিকের ড্রাম, মাটির পাত্র, বাসতি, টিনের কোটা, ডাবের খোসা/নারিকেলের মালা, কফটাইনার, মটকা, ব্যাটারী শেল ইত্যাদিতে এডিস মশা ডিম পাড়ে। কাজেই এগুলো বর্জ্য হিসেবে ব্যবস্থা নেয়া।

অব্যবহৃত পানির পাত্র ধ্বংস অথবা উল্টে রাখতে হবে যাতে পানি না জমে।

দিনে অথবা রাতে দুয়ানোর সময় অবশ্যই মশারি ব্যবহার করুন।

সেবা নিন, সুস্থ থাকুন
ডেঙ্গু হলে নিকটস্থ স্বাস্থ্য কেন্দ্রে যোগাযোগ করুন

স্বাস্থ্য শিক্ষা বোর্ড, স্বাস্থ্য অধিদপ্তর
স্বাস্থ্য সেবা বিভাগ, স্বাস্থ্য ও পরিবার কল্যাণ

ডেঙ্গু প্রতিরোধযোগ্য, সচেতন হন এবং কিছু সাধারণ সাবধানতা অবলম্বন করুন

ডেঙ্গু একটি ভাইরাস—ঘটিত জ্বর এবং এডিস মশা এই রোগের বাহক।

কী করবেন

- জলের ট্যাঙ্ক, চৌবাচ্চা এবং বাড়ির সব জল ঘরে রাখার পাত্র, প্রতি সপ্তাহে দুইবার খালি করে, ঘষেমেজে শুকিয়ে নিন এবং ভালো ভাবে ঢেকে রাখুন।
- এ সি মেশিন, এয়ার কুলার ইত্যাদিও সপ্তাহে দুইবার ভালো করে মুছে শুকিয়ে নিন।
- বাড়ির চারপাশের পরিবেশ, বাড়ি-সংলগ্ন নর্মা পরিষ্কার রাখুন।
- বাড়ির ভিতরে বা আপোশে ফেলে রাখা ডিম ও ডাবের খোসা, ব্যবহৃত প্লাস্টিকের কাপ/থামেকলের থালা-বাটি / মাটির ভাঁড়, আবর্জনা ইত্যাদি নিয়মিত পরিষ্কার করুন ও নির্দিষ্ট জায়গায় জগ্গাল ফেলুন।
- মশার কামড় এড়াতে গা-ঢাকা হালকা রঙের পোশাক পরুন।
- দরজা-জানালায় মশা-প্রতিরোধক জাল লাগান।
- ঘরের ভিতরে রাখা তুলপু জিনিস, আসবাবপত্রের নীচের অংশ, ঘরের অন্ধকার কোণ পরিষ্কার রাখুন।
- ঘরে মশা তাড়ানোর হুপ, মাটি, কয়েল বা মশানাশক তেল ব্যবহার করুন।
- এডিস মশা সাধারণত দিনের বেলায় কামড়ায়। তাই রাতের পাশপাশি দিনের বেলাতেও, দুয়ানোর সময় মশারি ব্যবহার করুন।
- ডেঙ্গু-আক্রান্ত এলাকায় ঘরের রোগীকে অবশ্যই সব সময় মশারি মশা রাখুন।
- জ্বর হলেই ডাক্তারের পরামর্শ নিন। জ্বর কমাতে প্যারাসিটামল খান ও প্রয়োজনে রক্ত পরীক্ষা করান। সস্বে বেশি করে জল ও তরলজাতীয় খাবার খান। ডেঙ্গু-নির্ণয়ের জন্য এলাইজা পদ্ধতিই সঠিক পরীক্ষা।

কী করবেন না

- ডেঙ্গু-বাহক এডিস মশা সাধারণত পরিষ্কার জমা জলে জন্মায়। তাই গবাদিপশু ও শোষা পানির জল খাওয়ার পাত্র, ফুলের টব, পুরনো টায়ার, পরিত্যক্ত ব্যাটারির সেল, শিঙের ড্রাম, বাড়ির আশপাশে থাকা বানানুসঙ্গে বর্জ্যকাল জল জমতে দেবেন না।
- জ্বর ও ব্যথা কমানোর জন্য অ্যাসপিরিন বা আইব্রুপ্রোফেন জাতীয় ঔষধনিরোধক ওষুধ খাবেন না।
- অথবা আতঙ্কিত হবেন না। অধিকাংশ ডেঙ্গু রোগীই সময়মতো সাধারণ চিকিৎসায় সেরে যান।

Figure: Community dengue prevention.

1. Due to the enormous number of participants, the outcome is considerably more favorable for use in a large area.
2. It unifies the inhabitants of a specific community or society.
3. It allows adolescents and students to cultivate their leadership capabilities.
4. It is possible to acquire knowledge of novel dengue prevention methods through dialogue with others.
5. When it comes to community-based prevention methods, a wide range of technological tools and social media platforms are readily available
6. In contrast to chemical prevention methods, community-based prevention approaches do not involve using any form of chemical.
7. The method prioritizes environmental sustainability and mosquito control.
8. Volunteers perform every activity, eliminating any financial burden associated with implementing this method.
9. A locality or society becomes more harmonious than ever thanks to community-based prevention methods.
10. Numerous distinct kinds of animal abuse occur when using biological methods. This form of animal cruelty is not committed by community-based
11. Onerousness regarding the prevention of dengue and other diseases is heightened through the use of this method.
12. Community-based practices facilitate immediate dengue prevention during extreme dengue outbreaks.
13. Community-based interventions impede the transmission of dengue to foreign regions and nations.

Sustainable Dengue Prevention and Management:

The collaborative approach should inherently be reciprocal, involving comprehensive feedback from all stakeholders. This is especially crucial when adapting strategies to diverse geographic contexts and specific sub-groups. Some barriers to achieving strong, multi-stakeholder collaboration include a potential lack of alignment with the national priority for dengue prevention and a lack of clear leadership. If these barriers are not overcome, differences in stakeholder priorities can ultimately jeopardize the program's success. As a multi-pronged dengue prevention and management program comprises various initiatives implemented simultaneously by different stakeholders, a lack of coordination can lead to misalignment in the different prongs and cause delays in program implementation. For example, it is critical to drive the message that the introduction of new dengue vaccines does not diminish the need for continued vector control activities. When building a new narrative for new dengue vaccines, it is also important to emphasize its differences in comparison to previous dengue vaccines. While leveraging different stakeholders to communicate to the population can help to tailor messages to local contexts, the key narratives should remain consistent.

Conclusion

The mosquito-borne disease dengue is emerging in Bangladesh gradually at an alarming rate. In spite of having moderate knowledge of dengue transmission vectors and symptoms, the preventive practices are not well executed. However, it was found that the paucity of basic knowledge on dengue epidemiology and vector bionomics among the population could be a major cause for the increasing trend of dengue in this highly populated country. So, an emphasis should be provided on health education programme especially on dengue disease to increase community knowledge and awareness towards Aedes mosquitoes and DF prevention countrywide.
